Extract: At its July 1980 meeting, the Executive Board of the American Agricultural Economics Association authorized formation of an ad hoc committee to investigate systematically the status, role, and opportunities for women in agricultural economics. A survey of females and males in the profession, including but not limited to members of AAEEA, was undertaken. Because of the small number of women in agricultural economics (e.g., membership lists indicate that women comprise less than 5% of the AAEEA), all women who could be identified in agricultural economics or related specialties were included in the survey. A sample of the much larger population of male economists was selected.

Extract: Data from 358 households in 12 sites representative of climatic, geographical, and agricultural variations in the eastern communal areas of Botswana show that differences in the agricultural practices and extension contact of male- and female-headed households largely disappear when economic stratum is controlled. Female-headed households are shown not to be a homogeneous group. There appear to be greater similarities between farmers within the same economic stratum regardless of gender than between farmers of the same gender in different strata.

Farm women: contribution to farm and family.
Salant, P. Mississippi State : The Station. Agricultural economics research report - Mississippi Agricultural and Forestry Experiment Station. Mar 1983. Mar 1983. (140). 36 p. Includes 12 references. (NAL Call No.: 917031(AGE)). Extract: This study describes labor force participation by farm women in the Sand-Clay Hills region of Mississippi and Tennessee. Over half of the women in the 29-county study site were employed outside their homes in 1980, either on- or off-farm. Three fourths of those reporting employment worked off-farm, most frequently in the manufacturing and service sectors. They were most likely to join the labor force between the ages of 35 and 54, after their children had begun school. Earnings from off-farm employment contributed significantly to total household income.

Extract: A 10 percent stratified random
sample survey of migrant Hispanic farm
women was conducted in 1978 in Wisconsin
by bilingual interviewers. Interviews
with the women revealed that they have
greater numbers of children than other
women in the United States. They bear
children at younger ages, have greater
infant mortality, and use fewer
contraceptive techniques. We
hypothesize that their fertility
behavior is related to age, level of
education, and degree of assimilation,
the latter measured by bilingualism.
Results show that the variable most
strongly associated with live births is
age; when it is controlled, education is
the main predictor. When the effects of
both age and education are controlled,
bilingual capability also contributes to
explaining births. Education, on the
other hand, explains most of the
variance in expected number of children.

We conclude that high fertility patterns are likely to continue among migrant farm women until level of education improves for the children, thus increasing their bilingual capacity and improving their occupational opportunities.

Extract: Farm women are involved in their family's farming operations through labor participation and make an economic contribution to both the farm unit and the family unit. Although the major responsibility of the women is caring for the home and children, her farmwork is supportive of the farm unit since she is occasionally involved in almost half the farm tasks. Results from all the studies of task participation of farm women indicate that those women need specialized instruction and information to improve the quality of farm life.

Extract: The purpose of this paper is to provide a methodology that incorporates gender differences in the farm household into development project planning. The paper provides a quantitative comparison between a development project using a conventional planning methodology based on the aggregated farm household and a planning methodology in which project impacts are disaggregated by sex. Specifically, the study focuses on gender role differences relating to labour, income, and financial obligations among one ethnic group in central Nigeria--the Tiv--and the implications of these differences with

respect to the ability and incentive of each sex to adopt technologies introduced by an agricultural development project.

Extract: Research on the labor force participation of rural women is scant and has failed to examine separately farm and nonfarm-nonmetropolitan women. In this study, the socioeconomic correlates of labor force participation of metro, nonfarm-nonmetro, and farm women are identified. Data from a large statewide mail survey (N = 5,880 women) are examined to compare personal, socioeconomic, and family characteristics and the occupations and industries of women in the labor force. Findings regarding correlates of labor force participation indicate that family and status are the most influential correlates of metro and nonmetro women's labor force participation, while status factors are more influential for farm women.
